

Although I initially wanted to do something with Perlin noise (flow fields), I'm super glad Kapi (you..?) introduced me to boids and flocking (yayy!). My experience of wonder drawing fish at TeamLabs and seeing them appear on the screen always stuck with me, and I didn't realise it/why until I started learning Interaction Design. Seeing my friends beta test and get excited spotting their custom birbs flying around was really fulfilling, and even though it's just a mini Walmart TeamLabs, I'm glad to have made it myself and learnt so much along the way.

Honestly, the biggest thing I learnt from this project is the importance of syntax because I kept forgetting my semicolons.. (this was foreseen and foreshadowed but I still.. I still forget..) and also the importance of image formatting. In my head, converting everything to an image would be as simple as replacing things, but well, well, well. I especially struggled when I realised how important the borders/size of my images were for the wrap-around and avatar selection mechanics. Thank lord for saving directly into replacing files in my assets folder, or I would 100% have crashed out with how much spacing/sizing I had to redo. I do wish I pushed myself more to learn new things, because I feel like this project (other than learning Boids/Flocking) mostly used skills I already had, and I should have started earlier since Typography and Interactive I were really fighting for my time towards the end.

Ultimately, I am semi-happy with my final project, and I can't wait to see people try it! Thank you, Kapi, so much for this past semester, I've learnt so much about code (and artist life..?). WHAT WOULD I DO WITHOUT YOU... (all the pure IM kids have NO CLUE how those in Interactive I but not in Prog I are doing it...).
